Proposal for a Nuclear Talent course at the ECT* in 2025

We would like to propose a three-week Nuclear Talent course on theory for exploring quantum computing and quantum information science applied to nuclear physics at the ECT* for the summer of 2025. We believe such a course has a strong potential to attract many students, theorists and experimentalists alike.

Below we give a short motivation for the proposed course and the rationale behind the Nuclear Talent initiative. Thereafter we detail our course plans with learning outcomes, objectives and teaching philosophy, as well as various organizational and practical matters. The teaching teams consists of quantum computing theorists and nuclear theorists, with expertise ranging from many-body methods to quantum field theories. Several of us have developed courses on quantum computing and/or taught similar courses, in addition to our ongoing research on quantum computing. This spans from quantum engineering to developments of new algorithms and error correction studies. We believe such a mix is important as it gives the students a better understanding on how quantum computing can be applied to nuclear physics problems, and what are the

Motivation

Introduction to the Talent Courses

The TALENT initiative, [Training in Advanced Low Energy Nuclear Theory](#), aims at providing an advanced and comprehensive training to graduate students and young researchers in low-energy nuclear theory. The initiative is a multinational network between several European and Northern American institutions and aims at developing a broad curriculum that will provide the platform for a cutting-edge theory for understanding nuclei and nuclear reactions. These objectives will be met by offering series of lectures, commissioned from experienced teachers in nuclear theory and experiment. The educational material generated under this program will be collected in the form of WEB-based courses, textbooks, and a variety of modern educational resources. No such all-encompassing material is available at present; its development will allow dispersed university groups to profit from the best expertise available.

The Nuclear Talent initiative has organized and run several advanced courses since the summer of 2012. Several of these courses have been run and organized (in a very successful way) at

Aims and Learning Outcomes

This three-week TALENT course on nuclear theory will focus on the interpretation of data on the structure of nuclei using the Nuclear shell model as main tool.

Format: We propose approximately forty-five hours of lectures over three weeks and a comparable amount of practical computer and exercise sessions, including the setting of individual problems and the organization of various individual projects.

The mornings will consist of lectures and the afternoons will be devoted to exercises meant to shed light on the exposed theory, the computational projects and individual student projects. These components will be coordinated to foster student engagement, maximize learning and create lasting value for the students. For the benefit of the TALENT series and of the community, material (courses, slides, problems and solutions, reports on students' projects) will be made publicly available using version control software like *git* and posted electronically on [github](#).

As with previous TALENT courses, we envision the following features for the afternoon sessions:

Course Content and detailed plan

Week 1. Week 2. Week 3.

Teaching

The course will be taught as an intensive course of duration of three weeks, with a total time of 45 h of lectures, 45 h of exercises and a final assignment of 2 weeks of work. The total load will be approximately 160-170 hours, corresponding to **7 ECTS** in Europe. The final assignment will be graded with marks A, B, C, D, E and failed for Master students and passed/not passed for PhD students. A course certificate will be issued for students requiring it from the University of Trento.

The organization of a typical course day is as follows:

1. 9am-12pm: Lectures, project relevant information and directed exercises
2. 12pm-2pm: Lunch
3. 2pm-6pm: Computational projects, exercises and hands-on sessions
4. 6pm-7pm: Wrap-up of the day and eventual student presentations

If approved by the ECT* board of directors, our preferred time slot

Teachers and organizers

The organizers and teachers are

1. **Alexei Bazavov** at Department of Computational Mathematics, Science and Engineering and Department of Physics and Astronomy, Michigan State University, East Lansing, MI 48824, USA
2. **Zohreh Davoudi**, Department of Physics, University of Maryland, College Park, MD 20742, USA
3. **Morten Hjorth-Jensen** at Facility for Rare Isotope Beams and Department of Physics and Astronomy, Michigan State University, East Lansing, MI 48824, USA & Department of Physics, University of Oslo, N-0316 Oslo, Norway
4. **Dean Lee** at Facility for Rare Isotope Beams and Department of Physics and Astronomy, Michigan State University, East Lansing, MI 48824, USA
5. **Ryan Larose** at at Department of Computational Mathematics, Science and Engineering, Michigan State University, East Lansing, MI 48824, USA

Audience and Prerequisites

Students and post-doctoral fellows interested in quantum computing applied to nuclear physics problems, from nuclear structure to quantum field theories. The material will be of interest, and accessible, to both theorists and experimentalists, and will include learning the practical use of quantum computing software in order to interpret and study nuclear systems.

The students are expected to have operating programming skills in in compiled programming languages like Fortran or C++ or preferentially in an interpreted language like Python and knowledge of quantum mechanics at an intermediate level.

Admission

The target group is Master of Science students, PhD students and early post-doctoral fellows. Also senior staff can attend but they have to be self-supported. The maximum number of students is 20-30, of which hopefully at most 15-20 can receive full local support.

The process of selections of the students will be managed in agreement with the ECT*.

Preliminary budget

We expect to accept between 20-30 students. Local students from the University of Trento are fully self-supported. If approved, we would very much appreciate if the ECT* can sponsor 15-20 of the selected students with local expenses, that is lodging and meals during weekdays. Any additional funds for sponsoring further students is highly appreciated.

All travel expenses will be covered by the respective home institute. Teachers are self-supported. We plan to raise additional funds to cover local support for additional students and the expenses of the teachers.

There is no participation fee. Administrative support from the ECT* in organizing the course and setting up the application procedure is essential for a smooth (as always) outcome. The administrative experience of the staff at the ECT* has been unique and essential in running successfully our previous Talent courses. We would thus highly appreciate it if these services are provided if the proposal is approved.
